The Americas Grid Policy Management Authority MICS profile http://www.TAGPMA.org/

2 General Architecture

A MICS is an automated system to issue X.509 formatted identity assertions (certificates) based on pre-existing identity data maintained by a federation or large organization – the end-entity certificate is thus based on a membership or authentication system maintained by the organization or federation.

The goal is to leverage any existing, well-established identity management system to generate X.509 certificates fully compatible with those issued under the Classic Authentication Profile. In, in most cases, MICS X.509 certificates identify for identifying human individuals but may also identify, in some cases including automated or networked entities., and generate X.509 certificates for these entities that are fully compatible with certificates that would be issued to similar end-entities under the Classic Authentication Profile.

A MICS can be based on any primary authentication service to produce a Grid identity, as long as this primary authentication service meets the requirements of this Profile; the MICS will then map this primary identity to a Grid identity. In the CP/CPS that covers the MICS, the following processes must be described, and must be compliant with this Profile:

- The procedures and policies that govern the initial, primary, identity validation;
- How the primary identity management system is managed and secured;
- How the primary identity management system is connected to the MICS;
- How the primary identity is translated to the X.509 certificate;
- How the chain of trust is protected during the translation process.

page 5/10

To achieve sustainability, it is expected that the CAs will be operated as a long-term commitment by institutions or organizations rather than being bound to specific projects.

3 Identity

Version 1.0

Any single subject distinguished name (DN) in a certificate must be linked with to one and only one entity forwithin the whole of the service. Over the entire lifetime of the service. Service it must not be linked to any other entity. However, entities may have more thanthan one credential assigned to them. Private keys must not be shared between entities.

The subject DN used in a certificate may be is assigned to a one and only one person, service, or networked system. The registered The registered owner of the subject DN is the human individual or organizational group that has valid rights to exclusive use of that a subject name in the a certificate. ValidationThe process of thevalidation of the certificate request establishes the permanent binding between the end-entity, the registered owner, and the subject DN name. This is to ensure that the name when is subsequently reissued refers to the same end-entity it was issued to the first time.

Private keys must not be shared between entities.

3.1 Identity Vetting Rules for the Primary Identity Management System

3.2 <u>A MICS PKI CA must define the role of Registration Authority (RA) and how these RAs interact with the didM system process. Identity vetting rules for the primary identity management system</u>

The initial vetting of identity for any entity in the primary authentication system that is valid for certification should be based on a face-to-face meeting and should be confirmed via photo-identification and/or similar valid official documents. Sufficient information must be recorded and archived such that the association of the entity and the subject DN can be confirmed at a later date.

In <u>the</u> case of host or service entities, the initial registration should ensure that the association between the registered owner and the FQDN is correct, and sufficient information should be recorded to contact the registered owner.

In <u>the</u> case <u>where</u> the initial identity vetting is a distributed operation, these rules shall apply for all registration <u>authority (RA)</u> points and all identity validations that result in primary identities that can be translated by the MICS. Any distributed RA must have formal authority to recognize and establish end-entity identity.

The primary identity management system may contain other entities that do not qualify based on the above mentioned conditions, but it must not be possible for such entities to obtain valid credentials from the MICS.

3.3 Identity Translation Rules

3.4 Identity translation rules

All identities used to create <u>end-entity</u> certificates <u>must</u> be based on <u>a the</u> described primary_identity_ management system. A MICS authority must identify the organizational or federated identity management service that will be used to provide the authenticated identity to the MICS. The organization or federation must provide details of how the identity management system creates and validates identities for its users, and this information must be detailed in the CP/CPS of the MICS.

A MICS must describe in their CP/CPS:

1. How the identity (DN) assigned in the certificate is unique within the namespace of the issuer,

- How it attests to the validity of the identity., How the identity (DN) assigned in the certificate will never be re-issued to another end-entity during the entire lifetime of the CA,
- How it provides DN accountability, showing how they can verify shows that they have verified enough identity information to enable tracebacktracing to the physical person for at least as long as the certificate is valid and in keeping with the audit retention requirements. Inlf the event that documented traceability is lost, the DN must never be re-issued.

The identity management (IdM) system containing the identity information of the organization or federation must also meet the following conditions:

- 1. Re-usable private information used to authenticate end-entities to the IdM system must only ever be sent encrypted over the network when authenticating to any system (including any non-certificate issuing systems) that are allowed to use the IdM for authentication.
- 2. A second authentication factor not published and not normally used to authenticate to the IdM (i.e. a reasonable private factor) must be used to authenticate the end-entity for any certificate issuance.
- The end-entities must be notified of any certificate issuance, using contact information previously 3. registered in the IdM (for example by electronic mail).
- 4 From the information stored in the IdM it must be possible to determine if the requestor's identity has originally been validated using all initial vetting requirements described above.

A second authentication element not published and not normally used to authenticate to the IdM (i.e. a reasonable private identity verification element) may be used to authenticate the end-entity for any certificate issuance. The CP/CPS must describe how the 'private element' maps to the IdM identity and how it increases identity assurance. Answers to 'private element' questions get collected either at initial F2F registration or out-ofband with RA verification.

The IdM used by the CA should be an a identity management system that is also used to protect access to other critical resources - e.g. payroll systems; , for use in financial transaction support; transactions, granting access control for to highly-valuable resources - and should be regularly maintained. AlternatelyAlternatively, equivalent security mechanisms must be provided and described in detail and presented to the PMA with acceptanceand are subject to PMA agreement.

End-entity Certificate Expiration, Renewalcertificate expiration, renewal and Rere-keying 3.5

- For anyany, renewal or rekeying of the certificate by the MICS
 - The the registered owner must authenticate to the IdM and
 - The the MICS must follow the same identity translation requirements described above,

Certificates associated with a private key restricted solely to a hardware token may be renewed for a period of up to 5 years (for equivalent RSA key lengths of 2048 bits) or 3 years (for equivalent RSA key lengths of 1024 bits). Otherwise); otherwise, the certificate must be re-keyed.

Removal of a Certificate Authority from the Authentication Profile AccreditationRemoval of an authority 3.6 from the authentication profile accreditation

An accredited certificate authority (CA) should be removed from the list of authorities accredited under this profile if it fails to comply with this authentication profile document, or with the IGTF Federation Document, via the voting process described in the Charter of the appropriate PMA. to which this authority is accredited.

Operational Requirements 4

The MICS CA computer, where the signing of the end-entity certificates will take place, needs to be a dedicated machine, running no other services than those needed for CA operations. The CA computer must be located in a secure environment where access is controlled and, limited to specific trained personnel.

7 Audits

The MICS CA must record and archive all requests for certificates, along with all the issued certificates, all the requests for revocation and the login/logout/reboot of the issuing machine.

The MICS CA must keep these records for at least three years. These records must be made available to external auditors in the course of their work as auditor.

Each MICS CA must accept being audited by other accredited CAs to verify its compliance with the rules and procedures specified in its CP/CPS document.

The MICS CA should perform internal operational audits of the CA/RA staff and IdM interfaces at least once per year to verify its compliance with the rules and procedures specified in its CP/CPS document. Audit results shall be made available to the PMA upon request. A list of CA and site identity management personnel should be maintained and verified at least once per year.

 Profile for Member Integrated Credential Services X.509 Certification Authorities with Secured Infrastructure

 Version 1.0
 page 10/10
 Dated: 17 January

In order to establish the trust of the IdM itself, it is recommended that the IdM system make their periodic audits and reviews available to the MICS CAThe identity management system on which the MICS CA relies should undergo a periodic review or audit. This review should be conducted by persons other than the system operators.

8 Privacy and Confidentialityconfidentiality

Accredited MICS CAs must define <u>and follow</u> a privacy and data release policy compliant with the relevant national legislation. The MICS CA is responsible for recording (, at the time of validation), sufficient information to <u>uniquely</u> identify the person getting the certificate. The CA is not required to release such information unless provided by a valid legal request according to national laws applicable to that MICS CA.

9 Compromise and Disaster Recoverydisaster recovery

The MICS CA should have <u>a</u> <u>Business Continuity and Disaster Recovery plan</u>, and be willing to discuss this procedure in the PMA. The procedure need not be disclosed in the CP/CPS.

10 Due Diligence for SubscribersDue diligence for subscribers

The MICS CA should make a reasonable effort to make sure that <u>subscribers</u> realize the importance of properly protecting their private data.

For credentials with a life time longer than 1 <u>million secondsMs</u> that are issued to <u>user end entities, it is</u> incumbent human individuals, it is upon the user to protect the private key with a strong pass phrase. <u>End</u>entities must request revocation as soon as possible, but within one working day after detection of loss or compromise of the private key pertaining to the certificate, or if the data in the certificate is no longer valid.
